### Experiment 1 Measurement And Precision

Experiment 1: Measurement and Precision. EXPERIMENT 1: MEASUREMENT AND PRECISION. Objective: To determine the value of from the ratio of the circumference to the diameter of a circle. (Actually, the real point of this lab is to introduce you to the concept of uncertainty in measurements.) Theory: It has been known since ancient times that the ratio of the circumference of a circle to its diameter is equal to the transcendental number represented by  $\pi$ .

Accuracy is a measure of how close an experimental measurement is to the true, accepted value. Precision refers to how close repeated measurements (using the same device) are to each other. Example 1. 1: Measuring length Here the "ruler" markings are every 0.1-centimeter.

EXPERIMENT 1 Precision of Measurements Density of a Metal Cylinder Physics is a quantitative science, relying on accurate measurements of fundamental properties such as time, length, mass and temperature.

### EXPERIMENT 1 Precision of Measurements Density of a Metal ...

How good the calculations are depends on a number of factors: 1) how careful you are in taking the measurements (laboratory techniques); 2) how good your measuring device is in getting a true measure (accuracy); 3) how reproducible is the measurement (precision). ### Lecture Notes 1 + Experiment 1 : LABORATORY MEASUREMENTS ...

Accuracy is a measure of how close an experimental measurement is to the true, accepted value. Precision refers to the degree of uncertainty in a measurement. For example, a mass measurement of 48.26 g has an uncertainty of  $\pm 0.01$  g, while a measurement of 48.3 g has an uncertainty of  $\pm 0.1$  g.

### 1: Introducing Measurements in the Laboratory (Experiment ...

Precision is how close a measurement comes to another measurement. If using a particular tool or method achieves similar results every time it is used, it has high precision, such as stepping on a scale several times in a row and getting the same weight every time. ... In this example, the absolute deviations are 1.5 (2 – 3.5), 0.5 (3 – 3.5 ...

Take experimental measurements for another example of precision and accuracy. You can tell how close a set of measurements are to a true value by averaging them . If you take measurements of the mass of a 50.0-gram standard sample and get values of 47.5, 47.6, 47.5, and 47.7 grams, your scale is precise, but not very accurate.

### What Is the Difference Between Accuracy and Precision?

This first laboratory experiment will demonstrate the measurement of mass and volume using different types of equipment, demonstrate the difference between precision and accuracy, and use these skills to determine and calculate the density of an unknown substance. In other words, the precision of an experiment, object, or value is a measure of the reliability and consistency. The accuracy of an experiment, object, or value is a measurement of how closely results agree with the true or accepted value. Both accuracy and precision are terms used in the fields of science, engineering, and statistics.

The packaging in which you purchased the paper states that it is 11.0 inches long. You measure the length of the paper three times and obtain the following measurements: 11.1 in., 11.2 in., and 10.9 in. These measurements are quite accurate because they are very close to the correct value of 11.0 inches.

Experiment #1: Measurement Reproducibility ... Surprisingly, the precision of the blood glucose measurements was just as good as those of the control solutions. Looking at Figure 2, there's only a weak correlation between standard deviation and average glucose for a set of measurements ( $R^2 = 0.21$ ).

Accuracy is how close a measurement is to the correct value for that measurement. The precision of a measurement system is refers to how close the agreement is between repeated measurements (which are repeated under the same conditions). Measurements can be both accurate and precise, accurate but not precise, precise but not accurate, or neither.

1. Suppose during each of several measurements we find a value, which lies in the same interval of the scale of the measuring device. For example, each time we measure the length to be between 176 and 177 mm, with the length between the ticks on the ruler equal to 1 mm. How do we estimate an uncertainty in our the measured length in this case? 2.
